

Exercise 1. Bring Forth or Challenge Forth

The first picture shows the factories emitting chemical smoke. In my opinion, this issue is challenging forth. It is because of an example of environmental destruction caused by people. This example showcases how technology can be harmful to the environment when human beings abused their capabilities. It clearly shows that factories can be harmful because it causes air pollution. With this, it is a way that modern technology can destroy nature.

The second picture shows a photo of a dam. For me, this issue is bringing forth. It is because dams were invented to serve as a barrier to stop the flow of water. Furthermore, dams were used for water storage that supplies water for the community and agriculture. Additionally, dams also reduce and prevent the flood in low lying areas. Hence, it is a way that technology will advantage and benefit people.

The third photo displays a group of people who are collecting garbage. I think this issue is bringing forth because it shows proper waste disposal. In the photo, a group of people was collecting plastic bottles, and we know that these plastic bottles take a long time to decompose. Innovating and turning it into a new product will be a great help for us as well as for nature. Also, doing this is the right way to conserve the environment.

The fourth photo depicts a farmer. Based on the photo, this is an example of bringing forth. It is because the farmer uses a tool that helps him in farming. Using better technology, farmers can provide more crops, and it also requires them less work to do. Additionally, the technology is put into good because it helps people and it is not harmful to the environment.

The fifth photo shows an open pit and underground mine. For me, this is challenging forth because the process of mining can destroy the environment. Additionally, mining can also danger the lives of people. It is because it can contaminate the soil and water, which can lead to health issues in the local community. Although mining can provide minerals that benefit people, this process has a harmful effect when people abused it and use it illegally.

The sixth photo exhibits a windmill, and this is a bringing forth. This invention converts into energy to create electricity. It will benefit especially people who live in rural areas that do not have electricity. Moreover, structures like this have a huge impact on people's lives as it can supply energy that is important in everyday use. Thus, this technology does not harm people nor the environment.
